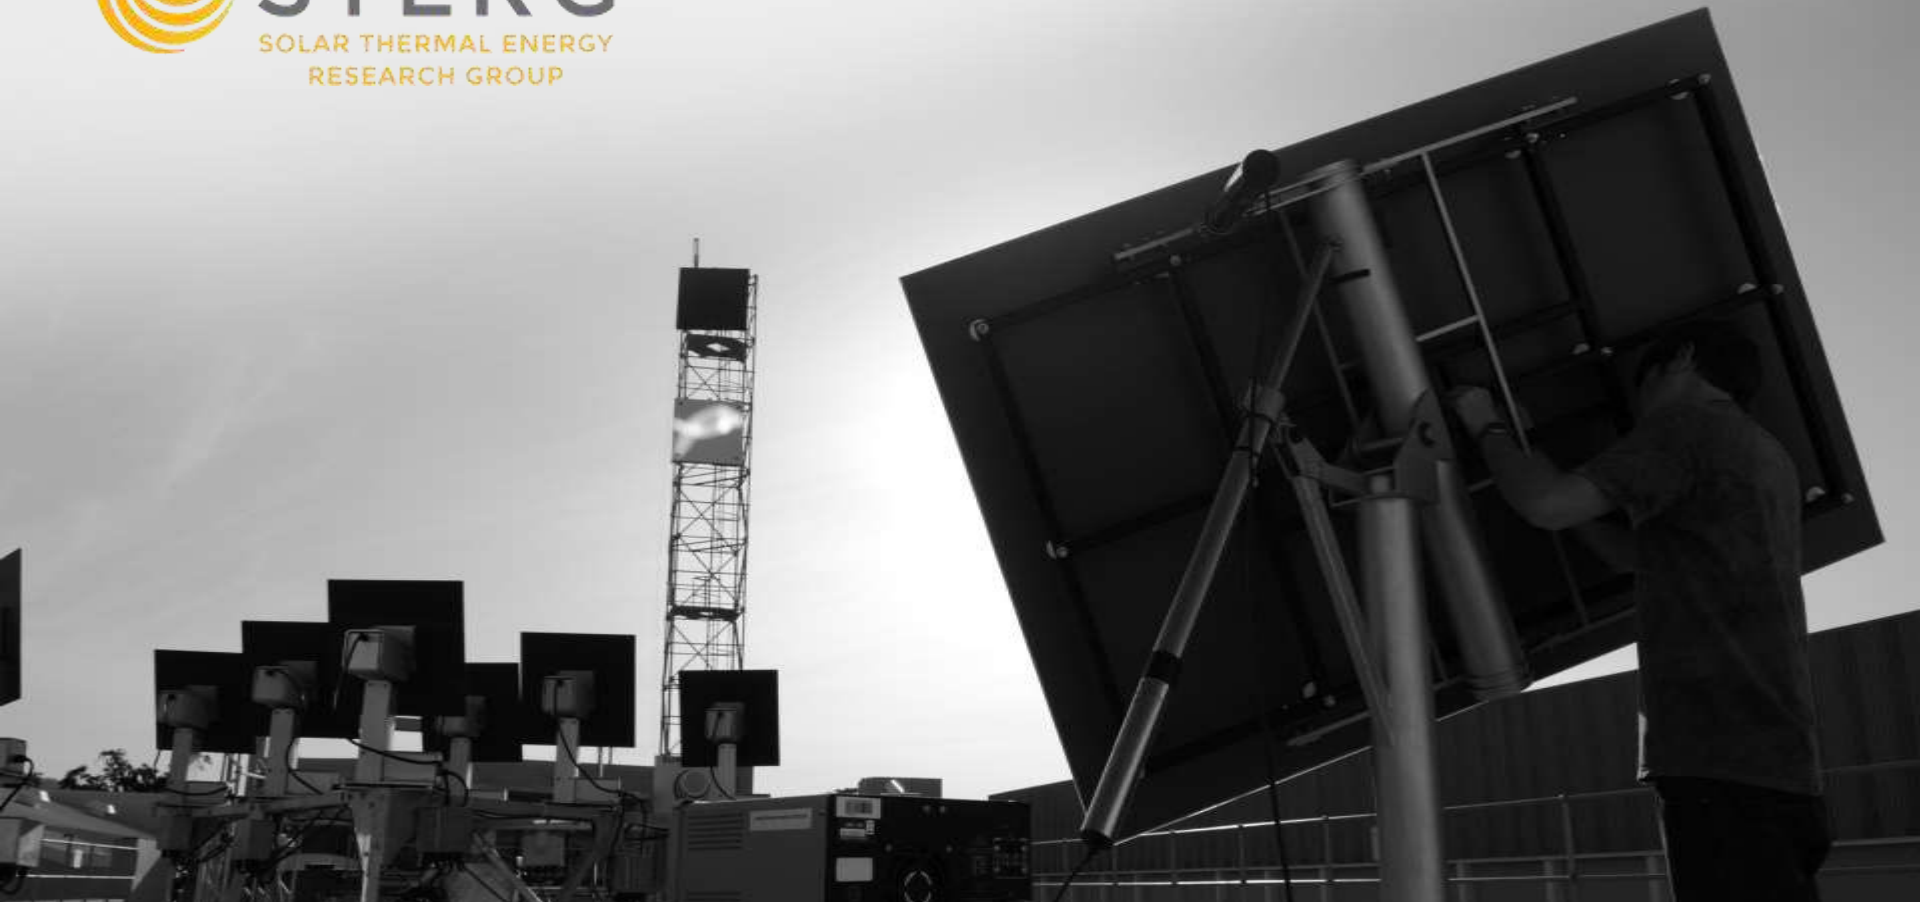
STERG

SOLAR THERMAL ENERGY RESEARCH GROUP



Simulating the effect of solarisation on the performance of a gas turbine

C. Homann[1],

J. van der Spuy [2] and T. von Backström [2]

[1]BEng (2013), 2nd year Masters Student (MEng); Solar Thermal Energy Research Group (STERG), Department of Mechanical and Mechatronic Engineering, Stellenbosch University

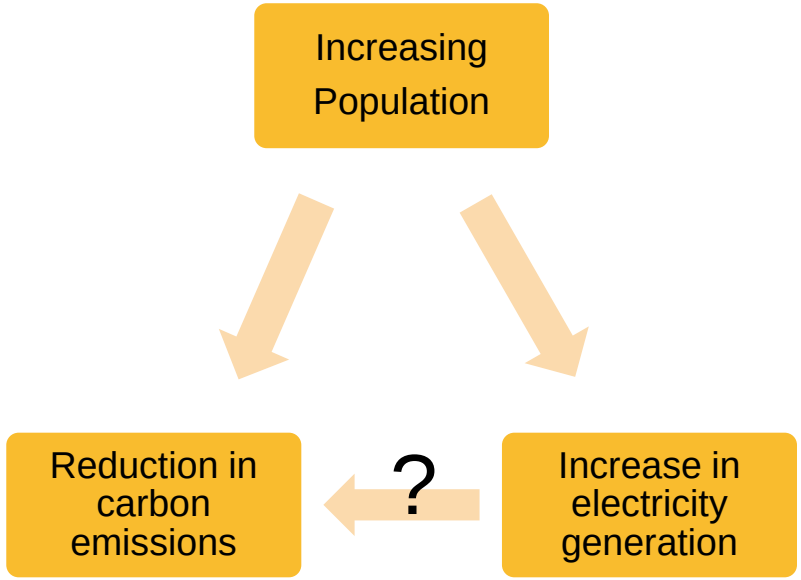
Contents

- Background
- Problem statement
- Methodology
  - Thermodynamic analysis
  - Flownex Simulation
- Results
- Conclusion
- Future work

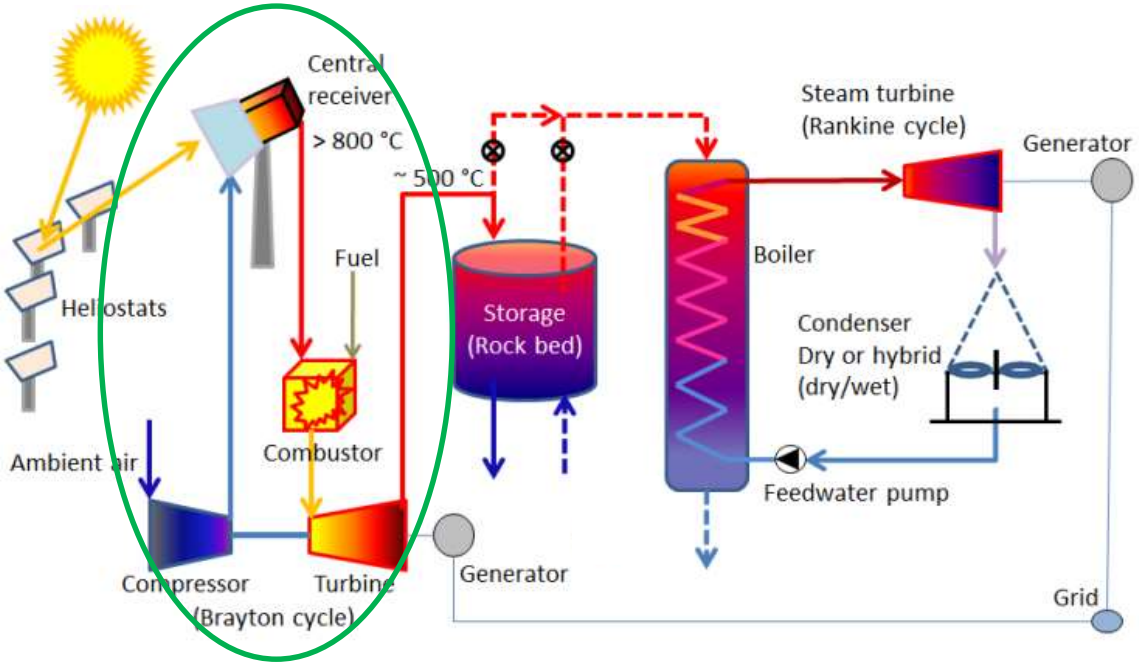
Background



- Biofuels
- Wind
- Hydro schemes
- Tide energy
- Solar energy

Background

SUNSPOT cycle (Kröger, 2011)



Solar-hybrid gas turbine

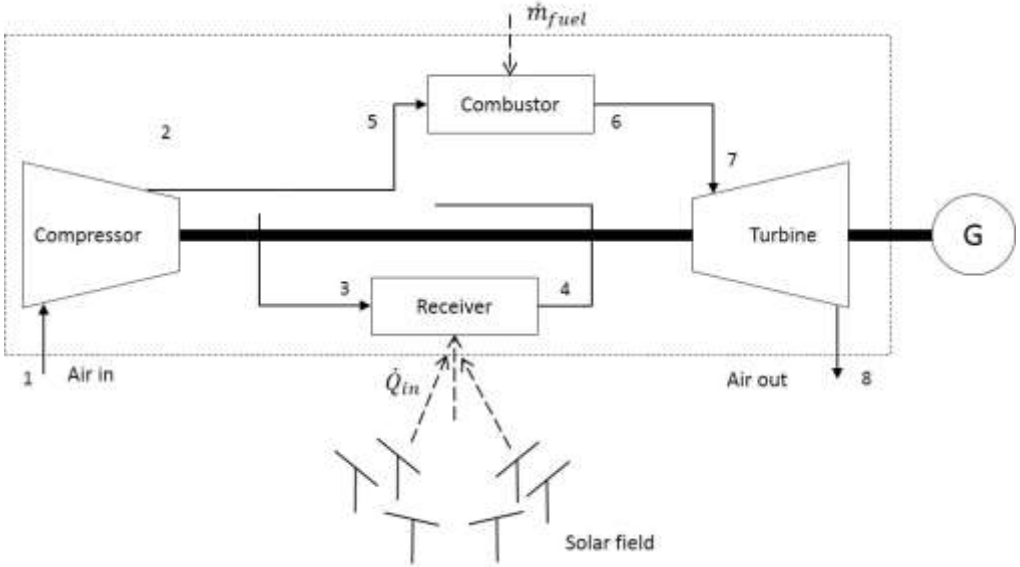
- Low water consumption
- High conversion efficiency
- Quick start-up/ shut-down times
- System reliability

Objectives

- Model the Rover gas turbine
- Design and model a solar hybrid Rover gas turbine
- Adapt and re-evaluate both the existing Rover gas turbine and solar hybrid Rover gas turbine, including a newly designed compressor
- Field testing of the Rover gas turbine
- Design and evaluate an interconnection device
- Feasibility of scaling

Thermodynamic analysis

Evaluating the Brayton cycle



Assumptions

- 5% pressure drop over combustor
- Turbine inlet temperature limit: 1032 K (manual)

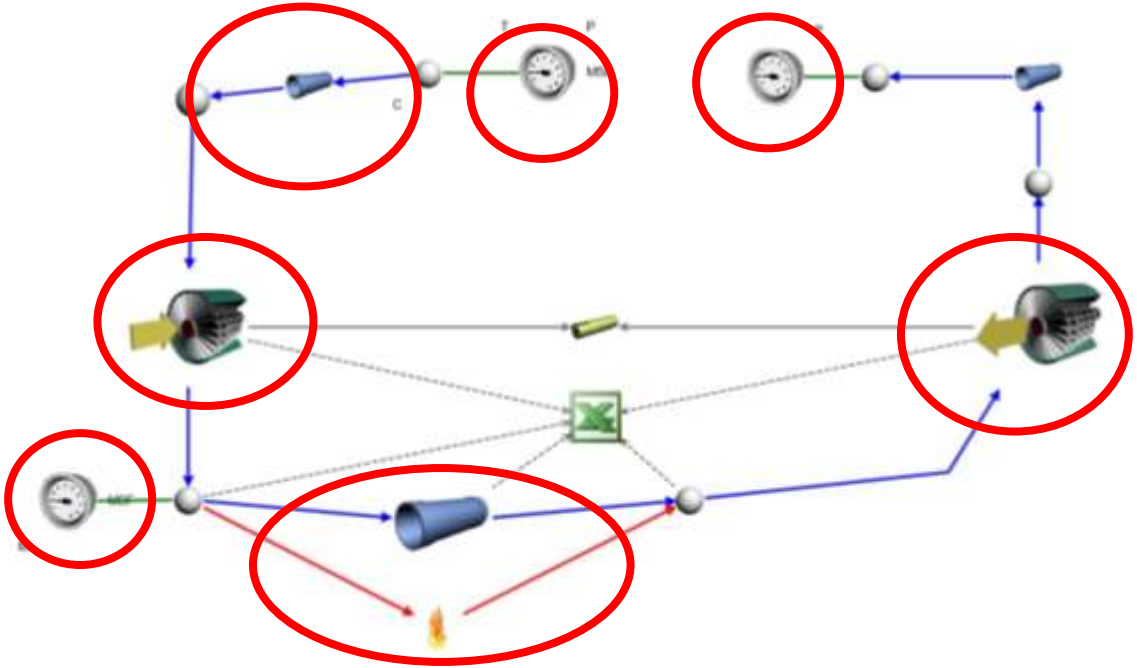
Equation summary

$$\dot{W}_{net} = \dot{W}_t - \dot{W}_c$$

$$\eta_{th} = \frac{\dot{W}_{net}}{q_{combustor}\dot{m}}$$

Flownex Simulation Environment

Rover gas turbine



- Intake system
- Compressor
- Turbine
- Combustion chamber
- Boundary conditions

Results

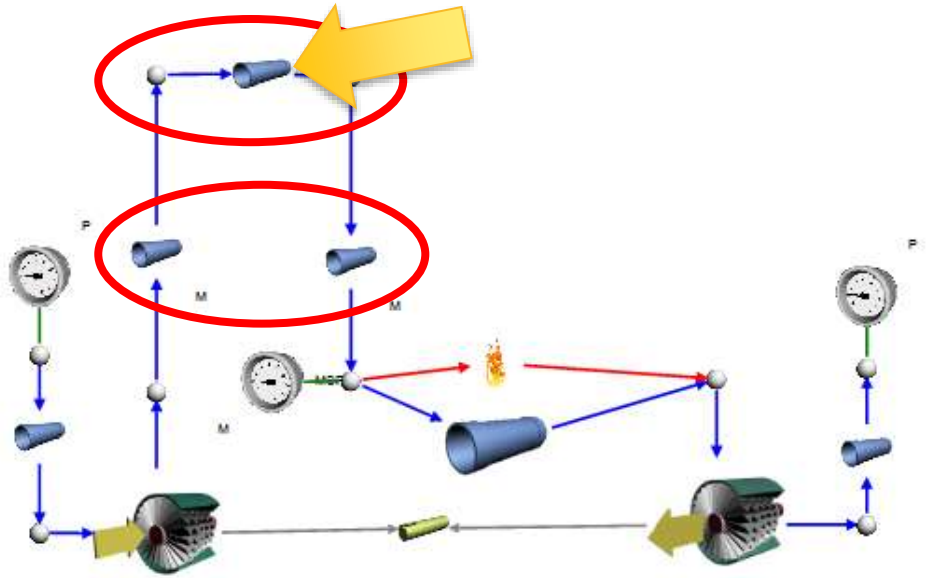
Model Validation

	Thermodynamic analysis	Flownex gas turbine model
Work output [kW]	43.32	42.41
Thermal efficiency	10.39%	10.59%
Combustion chamber ΔP [kPa]	14.18	13.95
Compressor efficiency	69.91%	70.00%
Turbine efficiency	85.14%	84.97%

- Less than 3% difference between analysis and Flownex model

Flownex® Simulation Environment

Solar-hybrid gas turbine model

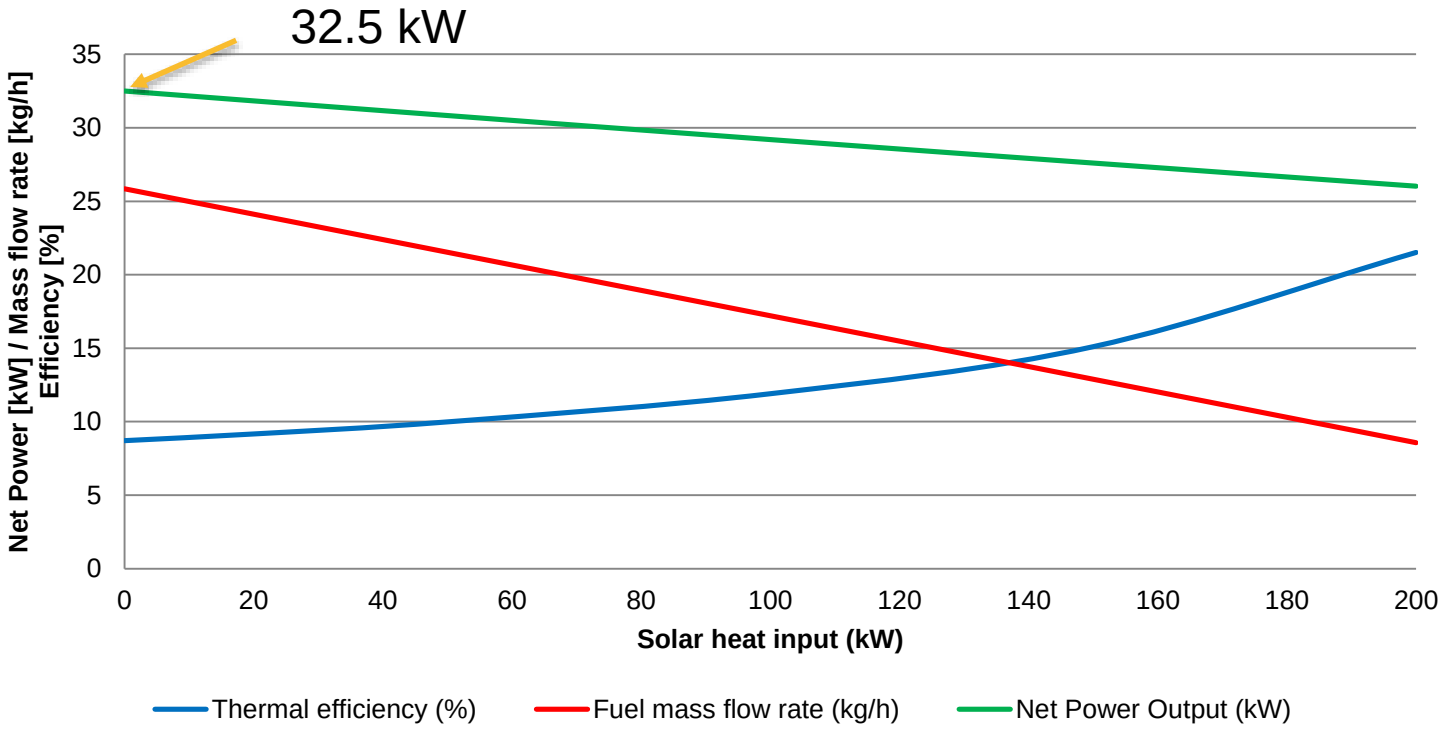


Solar receiver

- Pressure drop 12 kPa (SOLGATE receiver)

Piping up and down the tower

Results



32.5 kW
Net Power [kW] / Mass flow rate [kg/h]
Efficiency [%]

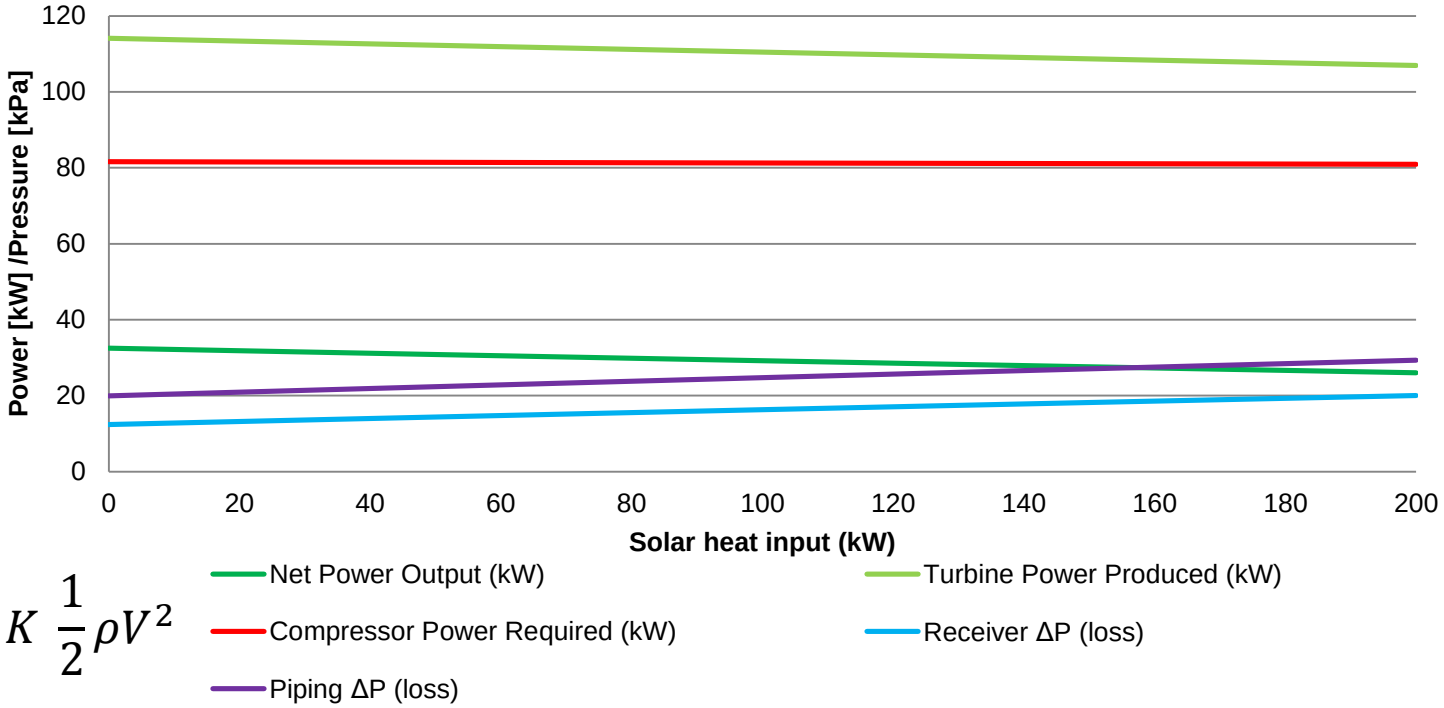
Solar heat input (kW)
Thermal efficiency (%)
Fuel mass flow rate (kg/h)
Net Power Output (kW)

Results



$$\Delta P = K \frac{1}{2} \rho V^2$$

Conclusion

- Simulations predicted Rover gas turbine performance within 3%
- Solar-hybrid gas turbine
  - Increase in efficiency
  - Decreased net power output

Future work

- Implement newly designed compressor
- Further refinement of the model
- Gas turbine field testing
- Design and analyse interconnection device
- Feasibility of scaling
